According to Delux Chen, the real selling point of the fancy product is the extra resolution of its screen. The 3,840 X 2,160-pixel resolution that is four times as many pixels as a standard 1,080p TV has been used extensively in the cinema but is now making its way into living rooms. However, the extra resolution isn't necessarily visible as science has put it that the human eyes can't resolve the difference between 1,080p and 4K from normal seating distances unless people look closely, and real differences emerge only from very close. The other downside of 4K TV is that, for the moment, 4K content is very scarce, and the TV has to up convert all that 1,080p content for the 4K big screen.

For some people, the failure of 3D TV is a good reason to like 4K because of the lack of 3D content that

is distaste many viewers have for 3D, as well as the fact that viewers have to don glasses, which is a bit heavy and uncomfortable. The coming along of 4K with extra pixels is expected to release the limitation of 3D's half the vertical resolution of 1080p (1,920 X 540 pixels), which caused visible line structure in some scenes. After visiting the tech extravaganza that is CES, some media reckoned that the tech of 3D has been yesterday's news with the glasses being reserved for gaming and the cinema, and 4K is taking its place to have more of an impact on the TVs we buy. So if all the manufacturers are able to pass this potentially substantial cost-saving factor onto consumers, it could instantly propel their screen right to the top of many an AV fan's next-gen wish list. 😊
